ECONOMIC STRATEGY / POLICY PROSPECTUS

THE 3.142 GROWTH COMPACT

Greece 2027-2036

A prospectus for a decade of productive, export-led expansion

Policy objective: sustain annual real GDP growth of 3.142%.

Investment, productivity, energy, skills and tradable-sector scale.

DISCUSSION DOCUMENT | 25 OCTOBER 2026

Prepared as a policy proposal; not an official government publication.

GROWTH THROUGH PRODUCTIVE CAPACITY

A measurable target. A disciplined programme. An honest scorecard.

INVESTMENT THESIS / 01

A decade-long growth compact

A proposal to target 3.142% annual real GDP growth from 2027 through 2036, with productivity and tradable capacity at its centre.

Greece has rebuilt momentum, but the next phase must be more than a continuation of consumption and tourism-led recovery. The European Commission estimated real growth at 2.1% in 2025 and projected 1.8% in 2026 and 1.6% in 2027; the IMF also highlights low investment, weak productivity growth and adverse demographic trends as constraints. The proposed 3.142% path therefore represents an intentional stretch ambition, not a consensus forecast. [1][2]

The proposition: turn Greece into a higher-investment, higher-productivity, export-capable economy - while maintaining credible public finances and spreading gains beyond the largest urban and tourism centres.

3.142%	+36.3%	2036	6
ANNUAL REAL GROWTH	**REAL GDP LEVEL**	**HORIZON**	**GROWTH ENGINES**
A fixed annual target, reviewed against evidence each year.	Indicative increase over ten years, from a 2026 index of 100.	Ten annual growth periods: 2027 to 2036.	Capital, energy, exports, technology, skills and place-based growth.

What would make the target credible?

- Invest more productively. Raise the share of investment in the economy from the reported 16.0% of GDP in 2024 toward 20% by 2030 and 22% by 2036, subject to a harmonised statistical baseline and project-quality tests. [3]
- Export more value-added output. Build on food, chemicals, materials, shipping and travel services, while expanding higher-value manufacturing, logistics, software and business services. Goods exports were approximately EUR 48.6bn in 2025, with fuel the largest category; diversification is a strategic priority. [7]
- Convert energy resources into industrial advantage. Accelerate grids, storage, renewables and interconnections so lower-cost, more reliable electricity attracts digital and industrial investment. Greece's Recovery and Resilience Plan has already supported renewable capacity, grid upgrades and storage. [8]
- Raise productivity and labour supply. Diffuse digital tools and AI into small firms, improve vocational and technical skills, support childcare and later-career employment, and attract skilled Greek diaspora talent.
- Protect fiscal credibility. Use transparent multi-year investment pipelines, competition and independent evaluation. The objective is growth that strengthens debt sustainability - not an unfunded spending promise.

Interpretation. 3.142% is a policy target, not a promise or an investment return. The numerical precision is a design choice; success should be judged by measured real output, productivity, employment quality, household incomes and debt dynamics - not by the decimal alone.

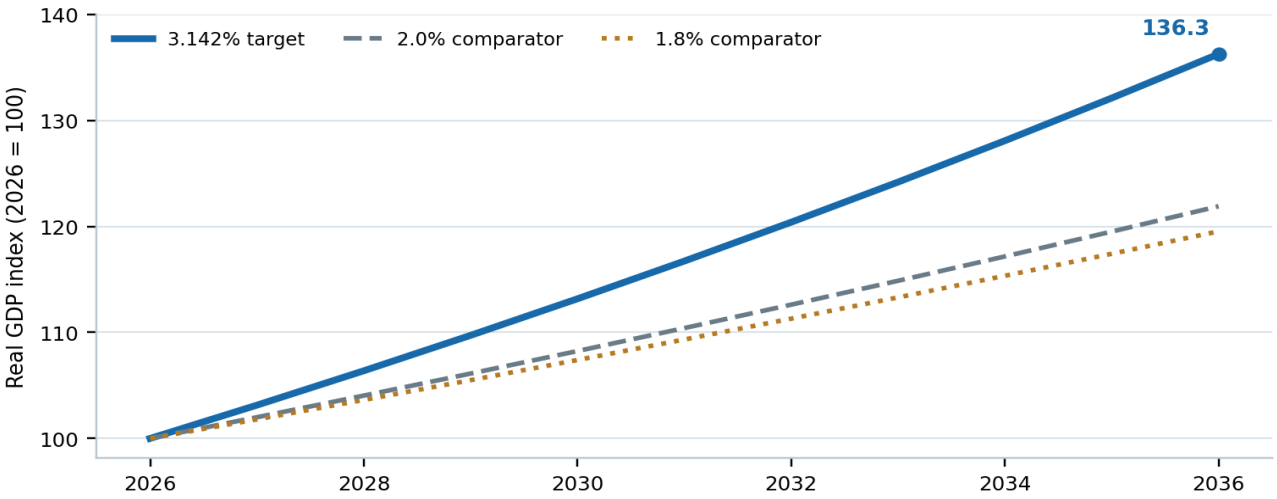

BASELINE AND ARITHMETIC / 02

The ambition in context

The ten-year path is materially faster than the near-term institutional baseline. It requires sustained improvements in investment efficiency and productivity.

INDICATOR	LATEST / BASELINE	WHY IT MATTERS
Real GDP growth	2.1% in 2025; EC forecast 1.8% in 2026 and 1.6% in 2027. [1]	The 3.142% target is above the current projected pace and should be treated as a stretch scenario.
Public debt	146.1% of GDP at end-2025 in the EC series; falling debt is forecast through 2027. [1]	Growth policy must coexist with fiscal prudence and continued debt reduction.
Investment share	16.0% of GDP reported for 2024 by Enterprise Greece. [3]	Capital deepening is a central route to improve output per worker; reconcile definitions before adopting targets.
R&D; intensity	About 1.53% of GDP in 2024 in final national data. [5]	More business R&D; and diffusion of existing technologies can support higher-value activity.
Travel receipts	EUR 23.63bn in 2025; up 9.4% year-on-year. [6]	Tourism is a major strength, but resilience calls for seasonality, local supply-chain and quality improvements.
Goods exports	EUR 48.60bn in 2025; provisional, down 2.8% year-on-year. [7]	The aim is to expand non-fuel goods exports and high-value services, not just nominal export totals.

Real GDP index scenario

Illustrative compound-growth arithmetic only. Each line starts at a real-GDP index of 100 in 2026. The 2.0% and 1.8% lines are comparators, not forecasts for every year of the decade. The target line reaches 136.26 by 2036, compared with 121.90 at 2.0% annual growth and 119.53 at 1.8%.

The growth gap must be earned in the real economy: more capital per worker, more value-added exports, greater participation, faster firm-level productivity and faster delivery of critical infrastructure.

Statistical caution. Forecasts, nominal GDP figures and national-account series can differ by institution and vintage. This prospectus uses the latest cited releases available as of 25 October 2026 and avoids treating them as interchangeable. The national target should use one official real-GDP series, rebased and benchmarked each year.

OPERATING MODEL / 03

Six mutually reinforcing growth engines

The compact is designed as a portfolio: each engine removes a constraint that would otherwise hold back the others.

ENGINE	POLICY DIRECTION	2030 CHECKPOINT
1. Energy and infrastructure	Expand renewable generation, grid capacity, storage, ports, rail freight, water resilience and cross-border interconnection.	Publish a sequenced national infrastructure pipeline; improve connection and permitting times.
2. Exporting firms and industry	Scale food processing, pharmaceuticals, chemicals, materials, components, repair, maritime services and specialist manufacturing.	Increase non-fuel exports and the number of firms exporting repeatedly.
3. Digitalisation and innovation	Help SMEs adopt cloud, cyber security, AI, automation, e-invoicing, digital inventory and data-driven production.	Raise business R&D; and measured digital adoption; increase high-growth firm survival and scale.
4. Skills and labour supply	Modernise technical education, apprenticeships, management skills, childcare access and skilled-diaspora pathways.	Raise employment and participation while keeping wage growth aligned with productivity.
5. Higher-value tourism and food	Extend the season, raise local purchasing, improve destinations and build branded, processed agri-food exports.	Raise receipts per visitor and shoulder-season occupancy, not arrivals alone.
6. Better institutions and places	Simplify permits, strengthen courts and land records, accelerate brownfield reuse and support growth hubs outside Athens.	Publish service standards and reduce time to open, build, connect and export.

The central design principle

Public policy should remove coordination failures and build shared infrastructure; private firms should make the commercial choices and bear normal commercial risk. Competitive grants, public guarantees and tax incentives must be time-limited, transparent and open to new entrants. Subsidies that preserve non-viable firms or favour politically connected incumbents should not qualify as growth policy.

A practical definition of success

- Real GDP grows near 3.142% over the cycle, with productivity and real incomes doing more of the work than population growth or temporary price effects.
- Investment increases without a corresponding deterioration in project quality, construction costs or public-debt dynamics.
- Exports diversify across firms, products and markets, helping narrow the external imbalance and reduce exposure to imported energy and capital equipment.
- The growth dividend is visible in employment, wages, business formation and local supplier networks across regions - not solely in asset prices or visitor volumes.

The engines are interdependent. For example, renewable power does not automatically create industry; it needs grid connections, skilled workers, predictable permitting, serviced land, finance and customers. Programme design should fund these chains end-to-end.

GROWTH ENGINE 1 / 04

Make energy and infrastructure a competitive advantage

Greece can turn geography, solar and wind resources, ports and regional connections into a platform for industrial and digital activity - if infrastructure is delivered as a system.

1. Deliver a grid-first energy programme

- Grid capacity before stranded capacity. Publish a transparent map of connection queues and reinforcement needs. Prioritise projects that remove binding bottlenecks for industry, storage and household electrification.
- Storage and flexibility. Procure batteries, demand response, pumped storage and other solutions through competitive markets and transparent system-planning tests. Keep balancing and network costs visible.
- Long-term power contracts. Standardise corporate power purchase agreements, credit enhancement for eligible SMEs and market-based hedging. Any public support should be disclosed and competitively awarded.
- Interconnections. Treat island links and international interconnectors as productivity investments, with cost-benefit analysis covering reliability, competition and avoided fuel imports.
- Efficiency. Target building retrofit, industrial heat recovery, smart controls and port electrification where measured lifetime savings exceed whole-life costs.

2. Build an investable infrastructure pipeline

Create a rolling ten-year list of projects for ports, freight rail, logistics parks, airports, broadband, water and climate adaptation. Each project needs a named sponsor, land and permitting plan, published business case, procurement route, financing plan and post-completion review. Start with maintenance and bottlenecks before prestige projects.

3. Prioritise projects with a productivity multiplier

PRIORITY	TARGET OUTCOME	CONTROL / SAFEGUARD
Port + rail freight links	Lower time and uncertainty for exporters, manufacturers and regional supply chains.	Open access, transparent tariffs, interoperable systems and forecast-to-actual cost reporting.
Industrial zones	Serviced sites with power, water, broadband, freight access and shared testing capability.	Recover land and infrastructure costs through clear user charges; avoid speculative land banking.
Water and climate resilience	Protect tourism, farming, cities and industry from drought, heat and flood disruption.	Use basin-level planning, drought pricing safeguards and lifecycle cost accounting.
Digital public infrastructure	Reduce administrative time, duplicate data entry and compliance costs for firms.	Privacy-by-design, cyber security, accessible human alternatives and audit logs.

Policy test: fund infrastructure that unlocks multiple productive users, not projects whose economic case depends on optimistic land values or permanently subsidised demand.

The EU-backed Recovery and Resilience Plan has supported renewable generation, storage and grid improvements, including more than 7.5 GW of new renewable installed capacity reported in the Commission factsheet. The next challenge is to convert these assets into reliable, affordable power and new tradable output. [8]

GROWTH ENGINE 2 / 05

Move from recovery to export scale

A larger tradable sector is essential for durable growth: it creates demand for technical skills, raises productivity through competition and reduces reliance on domestic demand alone.

Priority value chains

VALUE CHAIN	OPPORTUNITY	FIRST POLICY MOVES
Agri-food and ingredients	Olive products, dairy, fruit, vegetables, fish, herbs, processed foods and traceable ingredients.	Cold chain, packaging, certification, export cooperatives, water efficiency and branded products.
Pharma, chemicals and materials	Specialty chemicals, generics, medical supplies, building materials and circular inputs.	Shared labs, skills, predictable industrial permits and scale-up finance tied to export milestones.
Maritime and repair services	Ship management, marine software, retrofit, safety systems, equipment and green shipping services.	Link maritime expertise to Greek suppliers, engineering firms, training centres and port infrastructure.
Logistics and light manufacturing	Distribution, assembly, repair, components, cold-chain logistics and regional fulfilment.	Intermodal freight, serviced industrial sites, customs digitisation and interoperable data.
Software and business services	Cybersecurity, cloud operations, fintech, analytics, engineering and multilingual service exports.	Talent pathways, reliable power, digital infrastructure, procurement access and start-up scale-up capital.

An exporter scale-up compact

- Export readiness. Offer a single digital entry point for standards, certification, customs, export credit, market intelligence and trade missions. Keep assistance accessible to firms of all sizes.
- Finance orders, not losses. Expand invoice finance, export working-capital guarantees and receivables insurance with risk-based pricing, borrower co-risk and published loss rates.
- Supplier development. Use open supplier days and technical standards to connect large buyers in shipping, energy, tourism and construction with domestic SMEs.
- Make EU value chains work for Greece. Attract investment where Greece can build durable skills and supplier capability, rather than offering incentives solely to relocate accounting profits.
- Measure value added. Report non-fuel exports, domestic value added, recurring exporters, export intensity, high-growth firm births and product-market diversification.

Trade diagnosis

Provisional 2025 goods data show exports of EUR 48.6bn and imports of EUR 82.1bn. Fuel accounted for 26.1% of goods exports, while food and live animals accounted for 18.6%, manufactured products classified mainly by material 15.5%, and chemicals 13.0%. These figures point to real industrial capabilities but also to exposure to fuel prices and a persistent need to increase competitive domestic supply. [7]

The objective is not autarky. It is to make more Greek firms internationally competitive, diversify suppliers where strategically sensible, and earn more export revenue from each unit of energy, land and labour.

Selection rule: support shared infrastructure, standards and capabilities broadly; provide firm-specific incentives only where a clear market failure is demonstrated, results are additional, and clawbacks apply when commitments are missed.

GROWTH ENGINES 3 AND 4 / 06

Diffuse technology; deepen the talent base

A small firm using proven technology well can contribute more to productivity than a showcase project with no diffusion path. Greece needs both frontier innovation and broad-based adoption.

A productivity programme for SMEs

- Digital adoption vouchers with results. Co-fund cloud accounting, e-commerce, cybersecurity, inventory systems, industrial sensors and AI workflow tools through accredited providers. Tie the second payment to active use and verified outcomes.
- Extension services. Place engineers and digital specialists in regional productivity centres that diagnose process bottlenecks and help firms implement changes.
- AI with governance. Develop sector templates for agriculture, logistics, tourism, legal/accounting services and manufacturing. Protect privacy, record model use in critical workflows and keep human accountability.
- R&D; and commercialisation. Use competitive grants, university-industry labs, spin-out rules and milestone-based early-stage finance. Evaluate patent quality, licensing, new products, export revenues and research careers - not grant volume alone.

R&D; intensity: a measurable long-run objective

Final national figures put Greek research and development expenditure at around 1.53% of GDP in 2024, or about EUR 3.62bn. [5] The proposal is to target 2.0% of GDP by 2030 and 2.5% by 2036, with most of the increase coming from business investment and collaborative projects rather than an automatic expansion of public budgets. This is a proposed target, not a forecast.

Skills, labour supply and return migration

- Technical education. Align vocational programmes and apprenticeships to electrical engineering, grid operations, advanced manufacturing, software, maritime systems, construction productivity, nursing and elder care.
- Participation. Make childcare and elder-care support more compatible with work, improve re-entry for caregivers and remove avoidable barriers to older-worker employment.
- Skilled migration and diaspora. Create predictable, fast routes for scarce skills, improve recognition of qualifications and offer relocation support linked to jobs and training, not broad untargeted subsidies.
- Management quality. Embed lean operations, export management, digital security and data literacy into SME support. Productivity is often held back by processes and management capability, not only by a lack of equipment.

Institutional reforms that raise expected returns

Set public service standards for business permits, licensing, land registry, commercial dispute resolution and procurement. Publish median processing times and the share of cases resolved within the standard. Expand one-stop digital services but keep an accountable named decision-maker and an appeal path. Competition policy should discourage incumbent protection and address barriers to firm entry and scale. The OECD has highlighted the role of low capital stock, weak total-factor productivity and innovation gaps in Greece's long-run productivity challenge. [9]

Productivity bargain: public institutions reduce avoidable friction; businesses reinvest in technology, training and wages; workers gain portable skills and more productive job opportunities.

GROWTH ENGINE 5 AND 6 / 07

Upgrade tourism; widen regional prosperity

Tourism remains a strategic asset, but the next unit of growth should add more local value and resilience. Regional growth also depends on housing, water, transport, health and education.

Tourism: grow value, not pressure alone

Travel receipts reached EUR 23.63bn in 2025, up 9.4%, according to the Bank of Greece. [6] The next decade should focus on higher expenditure retained locally, a longer season, sustainable visitor management and stronger domestic supplier networks.

- Develop shoulder-season products around culture, walking, food, sports, conferences, wellness and educational travel; support marketing only where outcomes can be measured.
- Improve local transport, waste and water systems before approving visitor capacity that exceeds a destination's carrying capacity.
- Connect hotels and restaurants with Greek food, furnishings, textiles, technology and professional services through open procurement and supplier-development programmes.
- Improve tourism jobs through year-round training, career ladders, productivity tools and more predictable accommodation and transport for workers.

Agri-food: higher yield, quality and resilience

- Prioritise water-efficient irrigation, soil testing, precision agriculture, cold storage, cooperative processing and affordable insurance against climate shocks.
- Build traceability and recognised quality brands for olive oil, dairy, fruit, vegetables, fish, honey, herbs and processed food.
- Help farms capture more value through processing, packaging, logistics and export relationships, while maintaining food safety and labour standards.

Regional growth compacts

REGIONAL ROLE	POTENTIAL SPECIALISATION	ENABLING INVESTMENTS
Athens - Piraeus	Business services, shipping, technology, higher education, advanced logistics.	Urban transport, freight links, housing supply, skills and innovation spaces.
Thessaloniki - Central Macedonia	Food processing, logistics, materials, software, health and university spin-outs.	Freight rail, industrial sites, technical training, laboratories and cross-border trade links.
Western Greece and Peloponnese	Ports, agri-food, energy, tourism, manufacturing and water management.	Port access, cold chains, broadband, grid connections and drought resilience.
Islands and coastal regions	High-value tourism, marine services, renewables, aquaculture and local food.	Inter-island transport, water, storage, grid links, waste and healthcare access.
Northern and inland regions	Manufacturing, agriculture, forest products, logistics and cross-border services.	Rail and road bottlenecks, skills centres, industrial utilities and digital access.

Housing and place-based capacity

Productive growth becomes harder if workers cannot afford to live near jobs. Update land-use plans, permit infill and brownfield redevelopment, support energy-efficient rental supply and improve public transport. Avoid demand subsidies that simply inflate rents where supply is inelastic. Use transparent climate and heritage safeguards, with clear decision timelines.

CAPITAL PLAN / 08

Finance productive investment without a fiscal blind spot

The capital programme should crowd in private finance, deploy EU resources effectively and make all public exposure visible. Its purpose is to raise capacity and productivity, not to substitute the state for commercial risk assessment.

A proposed investment pathway

MEASURE	PROPOSED MILESTONE	IMPLEMENTATION NOTE
Investment share	Move toward 20% of GDP by 2030 and 22% by 2036, from 16.0% reported for 2024. [3]	Indicative targets; reconcile data definitions and publish a Eurostat-compatible baseline before formal adoption.
Public capital budgeting	Protect high-return maintenance, grid, freight, water, skills and digital projects.	Within EU fiscal rules and medium-term expenditure plans; compare cost, timing and expected output gains.
Private investment	Crowd in domestic savings, banks, pension capital, institutional investors and foreign direct investment.	Use co-investment or guarantees only where additionality, risk-sharing and public benefit are documented.
EU facilities	Use Recovery and Resilience Facility and other EU instruments for eligible, time-bound investments and reforms.	Build a post-RRF pipeline now; do not rely on exceptional grants continuing indefinitely.
Innovation capital	Expand venture, growth and equipment finance alongside commercial bank lending.	Independent investment committees, competitive terms, disclosures, portfolio risk limits and clawbacks.

Indicative financing architecture

CHANNEL	ROLE	GUARDRAIL
EU grants and facilities	Support eligible transition, digital, skills and infrastructure programmes.	Milestone compliance and timely disbursement; disclose absorption and final outcomes.
EIB / EIF and development finance	Provide long-tenor lending, guarantees, risk-sharing and scale-up instruments.	Independent due diligence; no automatic rescue of weak projects.
Commercial banks	Finance viable firms, equipment, export receivables and working capital.	Maintain underwriting standards; track SME credit availability, price and arrears.
Private equity and institutional investors	Fund expansion, technology, logistics, energy and export capacity.	Transparent governance, competition, tax compliance and realistic leverage.
Public budgets	Fund public goods, enabling infrastructure and market-failure interventions.	Multi-year ceilings, appraisal, procurement, audit and explicit liabilities.

A fiscal rule for the compact

- No project is approved without a published business case, realistic demand assumptions, climate assessment, procurement plan and operating-cost estimate.
- Guarantees, public-private partnership commitments, tax expenditures and contingent liabilities are published in a single fiscal-risk register.
- Projects are ranked by economic return and public value, not by geography as a political entitlement. Regional balance is pursued through fair competition and access to infrastructure.
- Where debt sustainability or market conditions deteriorate, lower-return projects are deferred before maintenance, high-return infrastructure or essential skills programmes are cut.

EXECUTION PLAN / 09

A decade, delivered in four phases

The programme should begin with delivery discipline and constraint removal, then scale proven investments and reforms. The first 100 days establish governance and the baseline; they do not promise instant macroeconomic results.

PHASE	FIRST MOVES	EXIT TEST
First 100 days	Appoint a Growth Compact Board; establish a common real-GDP baseline; audit delayed public projects and grid connection queues; publish a project-selection framework; start one-stop permit tracking.	Named owners, public dashboards, baseline definitions and a ranked 24-month delivery list.
2027-2028: unblock	Resolve critical grid and freight bottlenecks; simplify high-volume permits; launch SME digital extension; expand apprenticeships; standardise export finance and supplier programmes.	Measured reductions in permitting delays; completed bottleneck projects; documented SME productivity gains.
2029-2031: scale	Scale infrastructure with demonstrated returns; increase business R&D; expand export-ready clusters; grow all-season tourism and higher-value food processing.	Investment share approaches 20%; export diversification and productivity indicators improve for several consecutive years.
2032-2036: compound	Refinance and expand successful programmes; develop advanced manufacturing, marine services, digital and energy-intensive activity where competitiveness is proven; institutionalise evaluation.	Growth near the target over the cycle; durable real wage gains; declining debt ratio; stronger export base.

Governance structure

BODY	MANDATE
Growth Compact Board	Set priorities, resolve cross-ministry bottlenecks and publish a quarterly delivery report. Include independent experts and regional representation; publish conflicts of interest.
Independent Fiscal and Project Review	Review major cost-benefit cases, fiscal risks, contingent liabilities, procurement exceptions and post-completion outcomes. Use independent external assurance for large projects.
Sector delivery units	Own project schedules, permits, data and stakeholder coordination for energy, exports, skills, digital adoption, agri-food and tourism.
Statistical and evaluation function	Maintain consistent series, publish quarterly indicators and commission independent impact evaluations with counterfactuals where feasible.

Operating rhythm

- Monthly: delivery-unit review of critical paths, permits, procurement, connection queues and risks.
- Quarterly: public scorecard and parliamentary hearing; explain any missed target, corrective action and revised forecast.
- Annually: update the ten-year plan, publish a fiscal-risk statement and independently evaluate programmes for continuation, redesign or closure.

MEASUREMENT / 10

The public scorecard

Indicators are leading signals and accountability tools; proposed targets should be confirmed after data definitions are reconciled and independent modelling is completed.

METRIC	STARTING POINT	PROPOSED TARGET	FREQUENCY / OWNER
Real GDP growth	2.1% in 2025; institutional projections near 1.6-1.9% for 2026-27. [1][2]	3.142% annually as target; judge over multi-year periods, not a single quarter.	Quarterly / Hellenic Statistical Authority + Finance Ministry
Investment share of GDP	16.0% reported for 2024. [3]	Toward 20% by 2030; 22% by 2036, with harmonised definitions.	Annual / Finance Ministry + statistics authority
R&D; as % GDP	1.53% in 2024. [5]	2.0% by 2030; 2.5% by 2036.	Annual / National Documentation Centre
Non-fuel goods exports	EUR 36.9bn in 2025, provisional, excluding petroleum products. [7]	Real growth above GDP over the cycle; report volumes and domestic value added.	Quarterly / trade and statistics agencies
Labour productivity	Baseline to be fixed using Eurostat/ELSTAT series. OECD identifies productivity as a structural constraint. [9]	Sustainably faster output per hour; publicise by sector and firm size where data allow.	Annual / statistics authority + labour ministry
Tourism quality	EUR 23.63bn travel receipts in 2025. [6]	Higher real receipts per visitor and more shoulder-season activity, within local capacity.	Monthly / Bank of Greece + tourism ministry
Debt-to-GDP	146.1% at end-2025 in EC series. [1]	Continue a declining path under medium-term fiscal plans.	Quarterly / Finance Ministry + EC
Permitting speed	Establish median and 90th-percentile baseline in first 100 days.	Reduce median processing times by 30% by 2030 for selected high-volume permits.	Quarterly / line ministries + independent audit
Energy connections	Publish queue, capacity and time-to-connect baseline.	Reduce queue delays and report MW connected against plan each quarter.	Quarterly / energy regulator + grid operators

Targets other than the requested 3.142% growth rate are proposed programme milestones, not existing government commitments. They should be stress-tested using official data and independent economic modelling before becoming statutory or budgetary targets.

RISKS AND SAFEGUARDS / 11

Growth with resilience

The target is exposed to external demand, energy prices, climate risks, demographics and implementation capacity. A credible prospectus states how it will respond when assumptions fail.

RISK	TRANSMISSION TO GROWTH	MITIGATION
Weak euro-area demand	Slower export orders, investment delays and softer tourism demand.	Diversify markets and products; maintain flexible project sequencing; support viable exporters rather than preserving every firm.
Energy price shock	Higher household costs, production costs and inflation; lower real incomes.	Grid and storage investment, interconnections, efficiency, hedging literacy and targeted temporary support.
RRF transition or under-absorption	A drop in investment momentum or projects delayed beyond funding windows.	Front-load permitting and procurement readiness; build post-RRF financing pipelines; avoid recurrent spending tied to temporary receipts.
Ageing and emigration	Smaller workforce and growing care demands can constrain potential output.	Skills, participation, productivity, childcare, return migration and appropriate skilled-migration routes.
Climate and water stress	Damage to agriculture, tourism, infrastructure and insurance affordability.	Water management, resilient infrastructure, early warning, insurance reform and climate-adjusted project appraisal.
Cost overruns and capture	Investment absorbs funds but delivers fewer services or productivity gains.	Independent appraisal, open procurement, beneficial-ownership transparency, milestone payments and clawbacks.
Credit / property boom	Capital flows into speculative property rather than productive capacity; debt risks rise.	Monitor leverage, bank underwriting, housing supply and allocation of investment; maintain macroprudential safeguards.
Inflation outruns productivity	Competitiveness and real household incomes weaken.	Measure output per hour and unit labour costs; remove bottlenecks rather than relying on wage restraint alone.

Scenario management

- Upside: investment implementation accelerates, exports diversify and productivity rises faster than assumed. Scale proven projects and use fiscal space in line with debt rules.
- Central: average growth improves but misses the annual target in some years. Preserve the structural agenda and publish the reasons for the gap; do not manufacture compliance through nominal measures.
- Downside: external shocks, climate disruption or delays materially weaken output. Protect project maintenance, skills, safety nets and high-return infrastructure; defer lower-return projects and revise the target openly.

The target should be ambitious, but the process must be conservative: independent evaluation, credible forecasts and honest reporting are productive assets in their own right.

METHODOLOGY AND REFERENCES / 12

Definitions, assumptions and source notes

This is a policy prospectus for discussion, not an official Greek government plan, a macroeconomic forecast, or a guarantee of investment performance.

Core calculation

Let real GDP in 2026 equal an index of 100. If real GDP grows by 3.142% in each of the ten calendar years from 2027 to 2036, the 2036 index is: 100 x (1.03142)^10 = 136.26. The result is a 36.26% increase in aggregate real output over the period. It does not by itself imply the same increase in GDP per capita, household disposable income or welfare.

YEAR	INDEX (2026 = 100)	YEAR	INDEX (2026 = 100)
2027	103.14	**2032**	120.40
2028	106.38	**2033**	124.18
2029	109.73	**2034**	128.08
2030	113.17	**2035**	132.11
2031	116.73	**2036**	136.26

Methodology and limitations

- All growth-path figures are real-GDP index calculations. They are not nominal euro forecasts and do not include an assumption about future inflation or population.
- The prospectus proposes targets for investment, R&D;, exports and delivery. They are normative policy milestones; they require validation against harmonised statistics, fiscal plans and costed project pipelines.
- The 3.142% growth target is not derived from a formal production-function model. Before government adoption, the programme should be stress-tested with multiple scenarios covering labour supply, capital deepening, productivity, external demand and energy prices.
- Policy channels overlap. The document deliberately does not assign additive percentage-point contributions to individual sectors, because doing so without a calibrated model would imply unjustified precision.
- GDP growth alone is insufficient. The annual evaluation should include GDP per capita, output per hour, real wages, employment quality, poverty, regional disparities, environmental sustainability and debt dynamics.
