

Rhino Bank × Ellan Vannin Wealth Management

Strategic Investment Memorandum

British Protein Science Industrial Fund

Building a Vertically Integrated British Dairy, Whey Protein and Sports Nutrition Export Industry

Executive Summary

Rhino Bank and Ellan Vannin Wealth Management propose the creation of the **British Protein Science Industrial Fund**, a specialist investment platform designed to transform Britain's agricultural and dairy capabilities into a high-value nutritional technology industry.

The investment thesis is based on a fundamental economic observation:

Britain produces world-class agricultural inputs but captures insufficient value from the downstream processing and branding of those products.

British milk is largely sold as a commodity. Whey, historically treated as a low-value by-product of cheese production, is increasingly recognised as a valuable nutritional ingredient. Meanwhile, Britain imports large quantities of finished sports nutrition products, despite possessing the agricultural base, scientific expertise and manufacturing capability to produce them domestically.

The proposed fund will create a vertically integrated British protein science company that controls the entire value chain:

British farmland

↓

Dairy production

↓

Milk processing

↓

Whey protein extraction

↓

Sports nutrition manufacturing

↓

Premium British brand

↓

Global exports

The objective is to establish a British-owned nutritional technology company capable of competing in the global sports science, health and functional food markets.

Investment Vehicle

British Protein Science Holdings Ltd

A joint strategic investment platform between:

Ellan Vannin Wealth Management

Providing:

- patient long-term capital
- asset-backed investment
- family office style ownership
- strategic industrial investment

and

Rhino Bank

Providing:

- corporate banking
 - project finance
 - working capital facilities
 - export finance
 - international payment infrastructure
-

Investment Strategy

The fund will operate on a **build-and-scale model**.

Rather than immediately attempting to compete with multinational nutrition corporations, the strategy is:

1. Build a profitable vertically integrated demonstration company.
2. Establish the British Protein Science brand.
3. Develop export markets.
4. Replicate the model through further acquisitions.

The first asset becomes the foundation of a national network.

Initial Investment Programme

Total Initial Capital Requirement

£15 million

The initial investment creates a complete production ecosystem rather than a single processing facility.

Asset Allocation

1. Dairy Estate Acquisition

Investment:

£5 million

Acquisition of:

- productive dairy farm
- grazing land
- livestock
- milking infrastructure
- agricultural equipment

Target:

- 300–500 dairy cows
- 300–600 acres of land

Strategic purpose:

The dairy estate provides:

- secure milk supply
- full traceability
- quality control
- premium British sourcing story

The farm becomes the foundation of the brand.

2. Dairy Processing Facility

Investment:

£3 million

Development of a small-scale advanced dairy processing centre.

Capabilities:

- pasteurisation
- milk separation
- cheese production
- cream processing
- whey collection

The purpose is to maximise the economic output of every litre of milk.

A litre of milk should not produce one commodity product.

It should produce multiple revenue streams:

Milk:

↓

Cheese

↓

Whey Protein

↓

Cream

↓

Butter

↓

Speciality ingredients

3. Whey Protein Extraction Facility

Investment:

£4 million

Equipment:

- ultrafiltration systems
- membrane filtration
- protein concentration

- drying systems
- quality control laboratories

Products:

- whey protein concentrate
 - whey protein isolate
 - lactose ingredients
-

4. Nutrition Manufacturing Facility

Investment:

£2 million

Production capability:

- protein powders
- recovery drinks
- nutrition bars
- functional foods
- meal replacement products

Capabilities:

- formulation
 - flavouring
 - packaging
 - testing
-

5. Brand Development and Export Platform

Investment:

£1 million

Creation of:

British Protein™

A premium British nutritional science brand.

Positioning:

"Scientifically developed. British sourced. Globally trusted."

Production Model

The business model captures value at every stage.

Stage One: Agricultural Production

Grass and feed

↓

Dairy cows

↓

Milk production

Stage Two: Dairy Processing

Milk separated into:

Cheese

Premium dairy products

↓

Revenue stream one

Cream

Butter and speciality products

↓

Revenue stream two

Whey

Protein extraction

↓

Revenue stream three

Stage Three: Protein Manufacturing

Whey

↓

Whey concentrate

↓

Whey isolate

↓

Sports nutrition products

↓

Global export brand

Production Economics

Farm Production Assumptions

400 dairy cows

Average yield:

8,000 litres per cow annually

Annual milk production:

3.2 million litres

Raw Material Economics

The advantage of vertical integration is ownership of the primary input.

A conventional nutrition company:

Buys whey powder

↓

Pays market price

↓

Adds margin

↓

Sells product

British Protein Science:

Owns farm

↓

Produces milk

↓

Creates whey

↓

Processes protein

↓

Owns brand

The business controls:

- input quality
 - supply chain security
 - production costs
 - brand story
-

Protein Production

From 3.2 million litres of milk:

Estimated whey stream:

2.5–3 million litres

Potential output:

25–40 tonnes whey protein annually

Revenue Model

1. Premium Whey Protein Products

Production:

30 tonnes

Equivalent:

30,000kg

Consumer packaging:

30,000 × 1kg units

Retail price:

£35 per unit

Potential retail value:

£1.05 million

2. Cheese Production

Premium farm-produced cheese:

Potential annual revenue:

£500,000+

3. Cream and Dairy Products

Products:

- butter
- speciality dairy
- high-value ingredients

Potential revenue:

£200,000+

4. Tourism and Brand Experience

The dairy estate becomes a destination.

Activities:

- farm tours
- educational visits
- tasting events
- nutrition experiences

Potential revenue:

£100,000+

Mature First Estate Revenue Potential

Division	Annual Revenue
Protein products	£1.0m–£1.5m
Cheese	£500k
Dairy products	£200k
Tourism	£100k
Ingredients	£300k

Total Potential Revenue:

£2m–£3m annually

Strategic Value Creation

The first estate is not designed to become Britain's largest dairy operation.

It is designed as:

A technology demonstration asset.

Its purpose:

- prove vertical integration
 - create intellectual property
 - establish a premium brand
 - develop export channels
 - demonstrate replicability
-

Expansion Strategy

Phase Two: Regional Protein Network

Acquire additional dairy assets.

Target:

5,000 cows

Annual milk production:

40 million litres

Potential protein production:

500+ tonnes annually

Phase Three: British Protein Science Network

National platform:

Assets:

- dairy farms
 - processing plants
 - research centres
 - manufacturing facilities
 - export warehouses
-

Market Opportunity

The sports nutrition market has expanded beyond traditional athletes.

Demand drivers:

Health and Longevity

Ageing populations seeking:

- muscle preservation
 - healthy ageing
 - preventative nutrition
-

Fitness Economy

Growth in:

- gyms
 - personal training
 - recreational sport
-

Functional Foods

Consumers increasingly seek:

- protein breakfasts

- nutritional drinks
 - fortified foods
-

Medical Nutrition

Applications:

- elderly care
 - recovery
 - rehabilitation
-

Export Strategy

The company targets premium international markets.

Gulf States

Demand:

- premium health products
 - sports nutrition
 - trusted Western brands
-

Asia

Demand:

- clean-label products
 - quality assurance
 - British reputation
-

United States

The world's largest sports nutrition market.

Europe

Short logistics distances and established premium food markets.

Competitive Advantage

The company combines four advantages:

1. British Agricultural Reputation

Quality food production.

2. Vertical Integration

Control from farm to consumer.

3. Scientific Partnership

Potential links:

- Loughborough University
- University of Nottingham
- University of Birmingham

4. Premium Branding

Transforming a commodity ingredient into a global consumer product.

Strategic Importance

The project supports:

Food Security

Domestic production of strategic nutritional ingredients.

Industrial Strategy

Moving from commodity agriculture into advanced manufacturing.

Regional Development

Creating skilled employment in the Midlands.

Export Growth

Replacing imported nutritional products with British-made alternatives.

Investment Philosophy

The British Protein Science Industrial Fund follows a wider economic model:

Raw Material	Transformation	Export Product
Potato	Food manufacturing	Crisps
Barley	Brewing	Beer
Grain	Distilling	Gin
Milk	Biotechnology	Protein Science

The lesson:

The future of agriculture is not simply producing more raw materials. It is capturing more value from every unit produced.

Final Investment Proposition

Britain already possesses:

- farmland
- dairy expertise
- scientific capability
- engineering skills
- global reputation

The missing element is integration.

The British Protein Science Industrial Fund creates a new category:

British Nutritional Technology

A company built around:

- farming
- biotechnology
- manufacturing
- sports science
- export branding

A £15 million initial investment creates the foundation for a scalable British protein industry.

The strategic ambition:

Build Britain's first vertically integrated nutritional technology company — transforming British milk into a globally recognised health and performance brand.

Rhino Bank × Ellan Vannin Wealth Management

British Protein Science Industrial Fund

A sovereign-style investment platform for the next generation of British food manufacturing.
